

Leading universities in environmental sciences in Latin America

Abstract

Latin America is a region that is developing a lot and currently is improving his research standards significantly. The aim of this paper is to analyze the leading universities in Latin America in environmental sciences over the last decade (2004–2013). For doing so, we use the Web of Science database and some bibliometric indicators such as the total number of papers and citations, the *h*-index and the citations per paper. The study also shows a new indicator that normalizes the indicators in [0, 1] and with these results develops a weighted average. This approach is very useful to combine the data of different indicators that cannot be directly measured together. The results indicate that Brazil and Mexico are the leading countries in the region basically because they are very big countries compared to the rest. However, Chile obtains very good results per person because it is a very productive country in the region although much smaller. Some less developed countries currently publish a very low number of papers in this field and clearly needs to improve a lot in the future.

Keywords: Environmental sciences; Latin America; university analysis; bibliometrics; Web of Science.

Introduction

Latin America is a region that encompasses about twenty million squared kilometers and six hundred million people. Over the last decades, Latin America has been developing a lot under a wide range of perspectives. However, it is still below the standards of the developed nations. An important issue has been the development of the universities and the research infrastructures. In order to evaluate the development of these infrastructures one key indicator is the research production that is being developed in these institutions. In the literature there are many methodologies for carrying out this evaluation. An important one is bibliometrics which is defined as the quantitative study of the bibliographic material (Broadus, 1987). Bibliometrics has been implemented in a wide range of areas including management (Podsakoff et al. 2008) and fuzzy research (Merigó et al. 2015a).

In environmental sciences, there are also several bibliometric studies. For example, Khan and Ho (2012) studied the most cited articles in the field. Dragos and Dragos (2013) studied the factors that affected the scientific productivity in this area. Li and Zhao (2015) developed a bibliometric analysis of global environmental assessment research in a 20-year period. Ma and Stern (2006) developed a citation analysis of environmental and ecological economics. This analysis was extended by Hoepner et al. (2012). However, there is no study that has strictly focused on the Latin American region.

Therefore, the aim of this article is to analyze the research production in Latin America in environmental sciences. The main focus is at the university level in order to identify the leading institutions in the region. In order to do so, the study first considers the productivity of the Latin American countries in this area. Next, the analysis studies the leading universities in each of the countries considering a wide range of bibliometric indicators. The paper ends summarizing the main conclusions and results of the article.

Methods

The study uses the Web of Science (WoS) database in order to collect the bibliographic information. Particularly, it focuses on the results of six WoS categories that are usually considered to form the Environmental Sciences discipline (see Table 1). The analysis considers the results between 2004 and 2013 because a decade is a reasonably good period in order to obtain an updated picture of the current state of the art in the field. The search process was developed between September 2014 and March 2015. With the results obtained, this study focuses on the papers by Latin American countries.

In order to evaluate the information, this study uses a wide range of bibliometric indicators (Merigó et al. 2015b) including the number of papers (TP) and citations (TC), the citations per paper (C/P) and the *h*-index (Hirsch, 2005). Moreover, it also presents the Z-index which uses normalized results in [0, 1] in order to combine the results in the same scale and a weighted average that produces a single result for each university as follows: $Z = 0.4 \times \text{papers} [0, 1] + 0.5 \times \text{cites} [0, 1] + 0.1 \times h\text{-index} [0, 1]$.

Results

This section presents the results of the paper. The results are divided by country so we can see the leading universities in each Latin American country.

Publication structure of Latin American countries classified by categories

Before analysing the universities of each country, let us look into the total production of each country. Table 1 presents the number of papers that each country has published in environmental sciences between 2004 and 2013. The articles are divided by the six Web of Science categories that are usually referred to environmental sciences. Note that the USA is also included in order to get a general perspective of the productivity of each country.

Table 1: Publication structure of Latin American countries in Environmental Sciences

R	Country	EE	ESt	ES	LI	BC	EC	Total

22	Haiti	4	1	11	0	0	0	13

Abbreviations: R = Rank; EE = Engineering Environmental; ESt = Environmental Studies; ES = Environmental Sciences; LI = Limnology; BC = Biodiversity Conservation; EC = Ecology.

Brazil is the most productive country in Latin America in environmental sciences. This is quite logical because it is by far the biggest country in the region. Mexico and Argentina obtain the second and third place, respectively. Chile appears in the fourth position and shows a higher productivity rate because it is a much smaller country than the previous one. However, if we compare it with the USA, Chile still needs to improve a lot in order to become a leading country worldwide. The rest of the countries are less productive and needs to improve a lot.

Leading universities in Latin America in environmental sciences

Next, let us look into the leading universities in each country. First, let us focus on Brazil, the most productive country in the region. Table 2 presents the Top 30 universities in Brazil in environmental sciences. Note that the universities are ranked according to the Z-index which makes a weighted average between papers, citations and *h*-index as explained in the methodology section.

The University of Sao Paulo is the leading university in Brazil and in Latin American in environmental sciences. It is the university with the highest number of articles and citations. The Federal University of Rio de Janeiro obtains the second position although very close to the State University of Campinas and the State University of Sao Paulo. In general, Brazil has many universities with a significant research level as it is seen in Table 2.

Mexico is the second most significant country in this research area. Table 3 shows the leading universities in this region.

The National Autonomous University of Mexico (UNAM) is the leading university in the country and far away from the rest of the universities. By looking to the number of papers, the UNAM would obtain the first position in Latin America. However, it has a lower number of citations and *h*-index than the University of Sao Paulo.

Table 2: Leading universities in Brazil

Next, let us look into the leading universities in Argentina, the third most productive country in the region. Table 4 presents the results.

The University of Buenos Aires is the leading university in the country. From a general perspective, it would obtain the third position in Latin America after the University of Sao Paulo and the UNAM. Some other important universities in Argentina in this field are the National University of Cordoba, the National University of Comahue, the National University of La Plata and the National University of the Litoral.

Next, let us analyse Chile, the fourth most productive country and the most productive country per person. Table 5 shows the leading universities in the country.

Surprisingly, the University of Concepcion obtains the first position followed by the Catholic University of Chile and the University of Chile. Note that usually, the University of Chile and the Catholic University of Chile obtain the first two positions in the university rankings when considering all the research disciplines. The Austral University of Chile appears in the fourth position obtaining also remarkable results.

These four countries are the most productive ones. As it is seen in Table 1, the rest of the countries are significantly less productive so they rarely have some university in the Top 10. In this particularly study, we will see that only the University of Puerto Rico would be able to reach a remarkable position in the Latin American region. Note that currently Puerto Rico is part of the USA. However, since their population speaks Spanish, it has been included in the analysis. The fifth country in the ranking is Colombia, although far away from the previous four. Table 6 presents the ten most relevant universities in Colombia in environmental sciences between 2004 and 2013.

The National University of Colombia is the most productive and influential university. The University of the Andes and the University of Antioquia also obtain significant results for the country. However, none of them reach the Top 20 in Latin America.

Table 7: Leading universities in Venezuela

R	University	TP	TC	H	C/P	Z
1	Inst. Venezolano de Investigaciones Científ.	216	2320	10,74	24	0,9285
2	Universidad Central de Venezuela	263	1167	4,44	15	0,7140
3	Universidad de Los Andes	152	1648	10,84	19	0,6655
4	Universidad Simon Bolívar Venezuela	186	1137	6,11	14	0,5863
5	Universidad del Zulia	101	426	4,22	11	0,2913
6	U Nac. Exper. Llanos Occid. Ezequiel Zamora	7	940	134,29	5	0,2341
7	Universidad de Oriente	61	190	3,11	7	0,1629
8	Fundacion La Salle Ciencias Naturales	17	290	17,06	8	0,1217
9	Universidad de Carabobo	43	107	2,49	5	0,1093
10	Inst. Nacional de Investigación Agropecuaria	17	81	4,76	4	0,0600

The sixth country in the list is Venezuela. Considering that it is a bit smaller than Colombia, it presents equivalent results according to his size. Table 7 presents the Top 10 universities in this country.

The Venezuelan Institute of Scientific Research obtains the first position although the Central University of Venezuela is the most productive university. The University of the Andes in Venezuela and the Simon Bolivar University also obtain remarkable results for the country. However, none of them obtain a significant position in Latin America.

Next, let us look into the Peruvian universities. This country publishes less than half of the papers that Venezuela does although both countries have a similar number of people. Table 8 presents the results.

Table 8: Leading universities in Perú

R	University	TP	TC	C/P	H	Z
1	Univ. Nacional San Antonio Abad del Cusco	50	1483	29,66	20	1
2	Universidad Nacional Mayor de San Marcos	39	526	13,49	13	0,5543
3	Universidad Nacional Agraria La Molina	35	370	10,57	13	0,4697
4	Universidad Nacional de la Amazonia Peruana	24	458	19,08	11	0,4014
5	Universidad Peruana Cayetano Heredia	26	255	9,81	12	0,3540
6	Pontificia Universidad Católica del Perú	22	214	9,73	9	0,2932
7	Universidad Nacional de San Agustín	8	100	12,5	6	0,1277
8	Universidad Ricardo Palma	5	88	17,6	5	0,0947
9	Universidad de Piura	6	66	11	4	0,0903
10	Universidad Nacional de Trujillo	5	86	17,2	4	0,0890

The National University of San Antonio Abad del Cusco is the most productive and influential country in Peru. However, none of the universities have published more than one hundred papers although six universities have published more than twenty studies. By looking to these results, it is clear that Peru still needs to improve a lot in order to reach the standards of the other big countries in Latin America.

The remainder of South American countries are very small, so rarely they are able to have some university competitive at the Latin American level. However, Uruguay, Ecuador and Bolivia have some universities worth mentioning.

Table 9: Leading universities in Uruguay, Ecuador and Bolivia

R	University	TP	TC	C/P	H	Country
1	Universidad de la Republica	276	3593	13,02	29	URU
2	Pontificia Universidad Catolica del Ecuador	89	1818	20,43	22	ECU
3	Universidad Mayor de San Simon	55	684	12,44	18	BOL
4	Universidad Mayor de San Andres	61	651	10,67	14	BOL
5	Universidad San Francisco de Quito	34	332	9,76	12	ECU
6	Inst. Investig. Biológicas Clemente Estable	24	174	7,25	8	URU
7	Universidad Autonoma Gabriel Rene Moreno	14	144	10,29	8	BOL
8	Universidad de Guayaquil	8	97	12,12	5	ECU
9	Universidad Tecnica Particular de Loja	12	71	5,92	5	ECU
10	Universidad de Cuenca	10	48	4,8	5	ECU

The University of the Republic in Uruguay is the most relevant university in this country and his research production would include him in the Top 50 of Latin America. The rest of universities are less significant although the Catholic University of Ecuador is the most

influential country in Ecuador in this research discipline. The University of San Simon is the most significant university in Bolivia but very close to the University of San Andres.

Finally, let us analyze the leading universities in Central America and the Caribbean excluding Mexico which has already been studied in Table 3. The results are shown in Table 10.

The University of Puerto Rico is the most relevant university in this region and far away from the rest of universities. A key explanation for this is his entrance in the USA that has improved his research facilities and partner connections. The next four universities in this region are from Costa Rica. The sixth position goes to the Valley University of Guatemala and the seventh one to the University of the Habana in Cuba.

Conclusions

This study has presented a general overview of the leading universities in Latin America in environmental sciences. The analysis has first considered the most productive countries in order to identify the leading regions where the research is being developed. Brazil, Mexico, Argentina and Chile are the most relevant countries in Latin America. Focusing on the universities, the Top 3 are the University of Sao Paulo, the National Autonomous University of Mexico and the University of Buenos Aires. From a general perspective, Latin America shows an important research production in this field but still needs to improve a lot in order to become competitive at the World level.

In future research, we will expand this analysis to other regions and considering the leading universities in environmental sciences of the World. Moreover we may consider other research areas where this university analysis could be developed distinguishing between the Latin American level and the World level.
